

MILESTONE HODL TOKEN

ROBINHOOD CHAIN EDITION — \$RMHT

🔥🔥 Trust the process ✂️ Earn the growth 🔥🔥

WHITEPAPER V1.0 — DRAFT — 25_07_2026

⚠️ PRE-LAUNCH DRAFT — NOT YET DEPLOYED ON MAINNET — NOT INDEPENDENTLY AUDITED

This document describes \$RMHT contracts currently live on Robinhood Chain Testnet only. Mainnet contract addresses, final airdrop percentage, and independent audit findings are not yet available and will be published before any public mainnet launch. Automated SolidityScan results are available today (see Section VIII); a human security review is still pending.

NETWORK	TOTAL SUPPLY	BUY TAX	SELL TAX	AUTOMATED SCAN
Robinhood Chain (L2, ChainID 4663)	1,000,000,000 RMHT	0%	0%	SolidityScan — 93.13/100

I. ABSTRACT

Robinhood Milestone HODL Token (\$RMHT) is a fork of Milestone HODL Token (\$MHT, BNB Smart Chain), redeployed on Robinhood Chain — an Ethereum Layer 2 built on Arbitrum technology, with public mainnet since July 1, 2026. \$RMHT keeps the core principle of \$MHT — reward those who hold — using Chainlink Automation to release vault balances to holders as the project's market cap grows.

Compared with the original \$MHT contract, \$RMHT removes every mechanism that required active tax collection, auto-liquidity routing, or a progressive LP schedule, and removes any owner function capable of freezing or destroying a holder's balance. Liquidity is instead held by a dedicated, non-upgradeable custodian contract, and ownership renouncement is gated behind explicit configuration locks rather than left to a single deploy-time transaction.

II. THE PROBLEM

Most DeFi tokens suffer from the same structural flaws: dev wallets that dump, liquidity that disappears after launch, reward systems that require manual intervention, and teams that disappear once initial hype fades.

\$RMHT was designed to eliminate these failure modes at the contract level on a new chain, while closing gaps identified in the original \$MHT design — most notably, removing any code path that could freeze or redirect a holder's tokens.

III. THE \$RMHT SOLUTION

Four systems replace the tax/auto-LP/LP-flush stack from the original \$MHT contract:

SYSTEM	MECHANISM	BENEFIT
Milestone Rewards	Chainlink Automation releases 1.5% of the vault balance at each \$500,000 market-cap milestone (24h cooldown)	Holders earn RMHT automatically as market cap grows

SYSTEM	MECHANISM	BENEFIT
Liquidity Custodian	Uniswap V3 position NFT held by RMHTLiquidityCustodian — no decreaseLiquidity, no withdrawal, no selfdestruct	Liquidity is provably locked on-chain, not just declared
Permissionless Fee Collection	Anyone can trigger collect(), but fees always flow to a fixed feeRecipient set only by the owner	No front-running risk on fee destination, even after ownership is renounced
Oracle Safety	Uniswap V3 spot price behind a 24h cooldown, plus Chainlink L2 sequencer uptime check	Protects milestone triggers against short-term price manipulation

IV. TOKENOMICS

ALLOCATION	AMOUNT	%	DESTINATION
Smart-Vault	500,000,000	50%	Locked in contract — milestone releases only (1.5% / \$500K MCap)
Airdrop — \$MHT-BSC holders	≈65,000,000 (indicative)	≈6.5%*	1-for-1 distribution to \$MHT-BSC holders, off-chain distribution after final snapshot
Market	≈435,000,000	≈43.5%	Single-sided Uniswap V3 position, held by RMHTLiquidityCustodian
TOTAL	1,000,000,000	100%	Fixed supply — no mint ever

* Total supply is fixed at deploy. No additional tokens can ever be minted.

* The final airdrop percentage will be confirmed after the closing \$MHT-BSC snapshot; it is expected to land closer to ~10% once pending redistributions are completed. This will be published ahead of the mainnet airdrop.

V. FEE STRUCTURE

\$RMHT applies no buy tax and no sell tax at the token-contract level — wallet-to-wallet, buy and sell transfers all move at 0% token-level fee.

Trading fees (1% per trade, typical of the Uniswap V3 pool tier used) are collected at the liquidity-pool level, not by the token contract, and are routed by RMHTLiquidityCustodian to a fixed fee recipient — see Section VII.

TOTAL TAX	BURN	AUTO-LP	MARKETING
BUY / SELL / WALLET→WALLET	0%	—	—

VI. MILESTONE REWARD SYSTEM

Every block, Chainlink Automation calls checkUpkeep(). When three conditions are met — market cap ≥ next milestone threshold, vault balance > 0, and the 24h cooldown has elapsed — performUpkeep() fires automatically.

PARAMETER	VALUE
First milestone	\$500,000 market cap
Increment	+\$500,000 per milestone
Release per milestone	1.5% of the vault balance

PARAMETER	VALUE
Cooldown	24 hours between milestones
MCap oracle	Uniswap V3 pool price + Chainlink L2 sequencer uptime check
Claim	claimRewards() — anytime — proportional to balance

VII. LIQUIDITY CUSTODIAN — RMHTLiquidityCustodian.sol

RMHTLiquidityCustodian holds the Uniswap V3 position NFT for the \$RMHT/WETH pool and only allows fee collection (1% per trade) — there is no function to decrease liquidity, withdraw the position NFT, or self-destruct the contract. The contract is not upgradeable.

collect() is intentionally permissionless: anyone can call it, but proceeds always go to feeRecipient, an address controlled only by the owner. This removes any front-running risk on where fees end up. Crucially, this behavior persists even after ownership is renounced — feeRecipient stays fixed forever, and collect() continues to work indefinitely, with no dependency on any individual.

VIII. SECURITY & TESTING

SolidityScan automated security score: 93.13 / 100 — 0 Critical, 0 High, 5 Medium, 4 Low, 317 Info, 75 Gas findings. This is notably above the average score of comparable projects scanned (~61/100).

TEST SUITE	RESULT
RMHTLiquidityCustodian (Foundry)	18/18 passed — single NFT deposit, collect() always paid to feeRecipient regardless of caller, collect() works forever post-renounce, no decreaseLiquidity / no outbound transfer / no selfdestruct
RMHT token (Foundry, incl. 4 fuzz tests)	34/34 passed — constructor allocations, default exclusions, setConfig/lockConfig/renounce guard, Uniswap V3 + Chainlink price reads (sequencer, freshness), milestones (1.5% release, 24h cooldown), reward accrual & claim, rescueTokens (never touches the vault), reentrancy blocked on rescueTokens
Invariant tests (4 tests, 128,000 randomized calls each)	All passed, 0 unexpected reverts — total supply never changes, vault never exceeds its starting balance, contract balance always ≥ vault balance, vault never releases more than its starting value
TOTAL	56/56 tests passed

FEATURE	DETAIL
Ownership	renounceOwnership() blocked until configLocked and automationRegistry are both set — prevents a permanent vault freeze from a premature renounce
No blacklist / no forced burn redirect	No owner function can freeze, redirect, or destroy a holder's balance — removed entirely from the original \$MHT design
No buy/sell tax logic	No auto-swap, no auto-liquidity routing, no progressive LP tranches, no LP flush — removed entirely from the original \$MHT design
Reentrancy	Reentrancy blocked on rescueTokens (ETH path)
Independent audit	Not yet performed — planned before mainnet deployment; only the automated SolidityScan pass above is available today

IX. CONTRACT INFORMATION

PARAMETER	VALUE
Token name	Robinhood Milestone HODL Token
Symbol	\$RMHT
Network	Robinhood Chain — ChainID 4663
Total supply	1,000,000,000 RMHT (fixed)
Decimals	18
Solidity version	0.8.34 — optimizer 200 runs, via_ir
Mainnet contract address	⚠️ To be announced at mainnet deployment
Mainnet liquidity custodian address	⚠️ To be announced at mainnet deployment
Testnet — NonfungiblePositionManager	0xFFe6CFc4f759b65f9B62c9D05A9E21a78cE93e12
Testnet — RMHTLiquidityCustodian	0xd81AD39405579656f3E529195cfDf06cdE8b1DA3

X. ROADMAP

PHASE	MILESTONE	STATUS
Phase 1	Testnet deployment of custodian + token, 56/56 Foundry tests, SolidityScan 93.13/100	COMPLETED
Phase 2	Independent third-party security review	PENDING
Phase 3	Final \$MHT-BSC snapshot + confirmed airdrop percentage	PENDING
Phase 4	Mainnet deployment (mint → Uniswap V3 pool → deposit liquidity → transfer NFT to custodian → setConfig → lockConfig → setAutomationRegistry → renounceOwnership)	UPCOMING
Phase 5	\$500K market cap — first milestone live on Chainlink Automation	UPCOMING
Phase 6	Community growth & ecosystem expansion	UPCOMING

XI. OFFICIAL LINKS

CHANNEL	STATUS
Website / Dashboard	To be announced
Contract source + test suite	To be published for public verification ahead of mainnet launch
Telegram / Twitter / X	To be announced
